Please let us know if something is still missing or not clear enough Professional has every feature and EM has some limitations, however EM is much more affordable. Layer II two files are not

supported they've had quality for DJing. Not specifically for DJ Player, but every application will be smoother this way. One hour needs around 700 MB, plus you need 1 GB for smooth iOS operation, adding up to 1.7 GB storage space for a glitch-free 1 hour recording. It displays essential mixing and system status information. Audio CPU indicates how much computing headroom is left before audio starts dropping out; you don't need to worry about it. Green is best, orange is a little bit too hot, red is clipping, not good. A deck is similar to an audio player, such as a turntable, CD or MP3 player. The Two Hands layouts can only display 2 decks simultaneously. Doubletap to keep it activated. Shows your hot cue or loop points, the current cue position (red triangle), the current playback position (red line) and more. Hold SHIFT to display the three Quick FX controls. If you press PLAY while holding CUE or move your finger to the PLAY button, playback will be continuous and releasing CUE will not return to the cue point. Triple tap sets the cue point and the beatgrid to the current position (quick beatgrid). Short tap change permanently. Long tap change temporarily until you release the button. Vertical movement (Y axis) adjusts the filter frequency. Doubletap to return to the middle. Doubletap to return to the middle. Doubletap to return to the middle. Doubletap to return to the middle. Tapping on a Quick Fx knob turns the effect on, vertical and horizontal movements are changing the parameters, releasing the knob turns the effect off. For more advanced Fx control please refer to the Fx Panel. Changing the key works only if keylock is enabled. Tap on zero to reset. Tap on the key value to match key with the master deck. White lines indicate the start of a bar (4 beats sequence).

Don't move your finger, just tap and hold. Release and tap again on the artwork. If the music is playing, hold SHIFT for this feature. The size of the jump is adjustable with the LOOP knob. The size of the jump is adjustable with the LOOP knob. In Default layouts tap on to display the points panel. A loop is like a bookmark with a begin and an end point. Hot cues are displayed with the lime color. If you move the tap over the PLAY button, playback will continue. If a music reaches the begin point of the tap, the loop activates automatically, not letting the music go beyond the loop. Use the plus and minus icons to change the bpm value. It's an audible beat tick at every beat position. The tick is mixed into the deck's audio signal by default. If internal mixer mode is enabled and there are enough output channels for a prelistening signal, the tick is audible in the prelistening signal only. There are four controls available for each stem. If Fx is disabled for the stem, then effects will not change its sound. As the effect slots are connected to decks, effects work with external mixer mode too. The knob is the third parameter for echo, indicating a half beat length. The highlighted part shows that an additional highpass filter is enabled for the echo, so it will not rumble the bass. Tap on the knob to enable or disable the highpass filter. Reverb has an identical filter as well. With Slip Mode, when scratching or reverse playback is ended, the playback continues from a position where the track would have been if the scratching or reverse playback had not been happened. It will have no effect if the scratching or reverse playback happens for more than 64 beats which is more than half minute in most modern music. Any deck, but only one deck at the time, can be the Master Deck. The Status Bar on the top displays the letter of the current Master Deck.

In this moment, the Master Deck will become the loudest deck playing audio loudest according to the cumulated position of the channel fader and the crossfader. It will happen only if exactly one deck has a definite loudness advantage. Copy To Clipboard puts the current list to the clipboard, so you can paste it into a text editor or website. Any list can be copied, such as a track history, queue or any playlist. Searches in the iOS Music Library, Deezer, Dropbox and WebDAV Network Disk. A queue is a special playlist to queue up songs. Songs played from the queue automatically disappear from the queue. The edit mode icon is disabled on the example image above, because the current listing can not be edited, nor any tracks can be selected. This process takes a few seconds only and it's much faster than in other DJ software. If you remove a track from your music library, DJ Player keeps this data stored. It will be recovered when you play the same track again. Your data is safe with DJ Player! Recommended compatible track properties are highlighted with different colors.

Compatible bpm is highlighted with green color. Compatible key is highlighted with green, power boost mixing key is highlighted with blue color. This feature shows tracks with similar tempo and key to the currently playing track on the master deck. Move left or right to seek in the song. It is also audible when only the speaker or headphone is available no USB. Turn the encoder while still holding it down for searching within the preview. You can switch to the track history here as well. Use the dual track browser to copy files. Manage your tracks and playlists in iTunes on your computer or in the Apple Music app on your iOS device. Here is how. Thirdparty applications, such as DJ Player can read fully downloaded, offline music only. You can make distinct tracks or entire playlists offline, and removing downloads is also possible.

Those tracks are copyright protected and can not be played by thirdparty applications. You must purchase or acquire somehow the track you'd like to play. Playlists, genres and albums are essential. These playlists are not immediately visible in the Apple Music app or iTunes, because thirdparty apps have no full playlist management access to the iOS Music Library. Can import tracks from the iOS Music Library, Dropbox and WebDAV too. If you have a Deezer Premium Plus account, DJ Player can load any music from Deezer. Please note It asks for full access to be able to browse all your files, instead of just one dedicated folder. Both HTTP and HTTPS are supported. For a secure connection use HTTPS and Basic Authentication. Username and password can be set using this format Songs played from the queue automatically disappear from the queue. A sign will appear to indicate the track is in the queue. Tap again to remove the track from the queue. You can change a tracks position by tapping and moving its artwork or the empty place where the artwork should be. Make sure you have enough storage space for your recording. One hour needs around 700 MB. This provides great uncompressed audio quality and enough headroom for mixing and mastering. Its okay to temporary go into the yellow or red while blending from one track to the another. DJ Player doesnt use a limiter on your recording for maximum sound quality. If it works okay, the External Recording Signal Strength indicator will show you the input level. If you tap on a recording, choose OPEN IN to copy to other apps on your device. The text file is right next to the recording in the same folder. DJ Player doesnt list text files in the track browser, but you will see them in the Files app or File Sharing. How to use iTunes File Sharing. It keeps your data even if your subscription expires. Dont confuse this cloud with iCloud. This is a separate server infrastructure for DJ Player users.

DJ Player Cloud will sync your data automatically for all your devices. Sync happens once in every minute. This will allow you to recover your subscription at any time or fresh install. This will force DJ Player to copy the current database to iTunes File Sharing. This screen hosts all preferences. It doesnt control the hardware volume of the iOS devices speaker which can be controlled by the physical buttons on the side of the device. Some DJ controllers have MIDI master volume controls controlling this setting directly if mapped. Some other DJ controllers have hardware master volume controls, not having any effect on this setting. Its useful to keep the overall volume under control while mixing, and also sounds great if used with a good taste. Please note that 50% represents the full volume your devices are capable of. The range between 50-100% is designed for special occasions and may distort the signal. Mix has full volume for each deck in the middle position, its very similar to most crossfaders. Smooth has an equal loudness curve between the decks, good for long blend mixes of certain genres. The crossfader can be disabled for any deck too direct. In this mode the tracks are fully played from start to end. There is no automix, and there are no plans for automix yet this is a serious DJ tool, not a toy. This feature is disabled if a wired MIDI controller connected, because it diverts software controls from the actual hardware control positions. This is how Pioneer CDJs work for example. If a music reaches the begin point of the trap, the loop activates automatically, not letting the music go beyond the loop. It can be disabled here. The tempo knob reflects this by default, but it may be confusing for some users, so it can be inverted here. DJ Player outputs the individual decks in this case. As every deck has 3 dedicated effect slots, effects are still available when the internal mixer of DJ Player is disabled.

Set it to a higher value if you notice audio dropouts. This process takes a few seconds only and its much faster than in other DJ software. You may need to fix the beatgrid by hand for some tracks. Its often the place where the first bass drum kicks in. There are four ways to handle such songs You can fineadjust the loop without snapping it to any grid. You've got nothing to worry about. Play the track at a loud part. Adjust GAIN until the channels VU meter lights up in green. It adds gain if a tracks average volume is below 11 db. 11 db is a good reference point for quality mixing. Despite the fact, that often there is a volume control in line AFTER their mixer, and the real loudness is in the hands of the sound technician. That's more than enough for studio grade audio and any kind of mixing you might want to do. Despite of the great, almost limitless internal processing factors, the last step, the output must fit into the outputs limits. If it doesnt, pure digital distortion will happen. Digital distortion sounds much worse than analog distortion it crackles. But the output of the sound card or the loudness of the recording would become too low this way, relative to other applications or tracks. In other words, analog DJ mixers have been designed to handle the bad guys. Namely, they employ a limiter. But our approach is different than most so we can get you clean sound all the time DJ Players solution is based on how DJs actually see the VU meter. Nothing to worry about. No actionable information provided. Maybe approaching louder than it should be. I'll keep my eye on it. But it's still not loud enough. Let's back it down a bit. This system is designed to have the reference, 0 db level to look the best, encouraging DJs to play around there. If you somehow reach 6 db, you are still within the range of any sound card or output audio format. When both circles are red, you are outside the range and digital distortion will likely occur. Nobody had any problems with it.

And finally, the distortion levels look ugly, as they should. You can directly connect these to your iOS device, and they can charge and power it as well. It works great. Dont worry, this is NOT a hack. USB audio and MIDI through this adapter is an official iOS feature. Not every USB device is designed according to this standard unfortunately. A good indicator for class compliance if the USB device doesnt require a driver to work with Mac OSX. The USB Audio Class is a huge document and no manufacturer has ever fully implemented it. It's so big that fully implementing it doesn't make sense for any product. Its available as Tech Note 2274. If a product doesnt align perfectly with that, then it may work with some iOS version and doesnt work with some other iOS version. Even if your USB device has its own power adapter, iOS may still complain about power usage. How to connect The device you last plugged in will have the audio, the other audio devices will be ignored. In order to avoid compatibility problems, connect your audio devices before you launch DJ Player make sure it doesnt run in the background either. DJ Player was the very first software to support those together with Stereomusik, we invented it. There is a sequence discovered by a DJP user how to plug such config in Many users are reporting great results with Serato or Traktor timecode vinyl. Due to its lower frequency and filterless operation, we recommend Serato. The effect chain and mixer controls are still useable with this, so you can effect the incoming audio and mix it like a regular deck. Any sound card can deliver it. We are working on it. Serato is also recommended for turntablists, because DJ Player can seamlessly recover from a needle jump or a heavily distorted signal happens very often for backspins. A DVS signal may be assigned to any number of decks simultaneously. If your turntable have a phono output only such as a Technics, then always use a sound card with a phono input.

On the Traktor Audio 6, set the permanent settings on your computer. Serato is 1000 Hz, Traktor is 2400 Hz for example. Configure USB channels if needed. If playback is in reverse, swap your turntable cables or enable Alternative Phase. No Yes Moderate A message will also be displayed telling you to increase or decrease vinyl speed to catch up. Its like MIDI Soft Takeover, but on a turntable. The maximum range for this bias is 16%. Tapping on the tempo value in DJ Player resets the bias to 0. None of the Sync switching or Pitch Bend features are available. Works with Serato vinyls only. Not recommended for advanced turntablist tricks, because a needle jump will result in a jump in the playback as well. One timecode can control any number of players simultaneously. Get

creative with this great flexibility! Forward is the wet, reverse is the dry direction. You can find this switch on the big Fx screen. The effect chain and mixer controls are still useable in this mode, so you can effect the incoming audio and mix it like a regular deck. Hopefully this will prevent a broken needle, as you can react in time. The MIDI Monitor is always visible on the right, displaying the latest few incoming MIDI messages. When you push a button, turn a knob or move a fader, the MIDI controller sends a short message in MIDI format over the USB. Everything else happens in the DJ software. But thats a different story. If the MIDI controller hosts an audio device sound card, its a distinct device in the same box the audio part has nothing to do with MIDI. Its only the driver you install on your computer creating a virtual MIDI device. As you can not install drivers on iOS, Traktor DJ is the only software able to communicate with their controllers. For example, the Traktor Audio 2 is small, powerful and can also charge your iOS device. When the DJ software receives a MIDI message, there is no information attached what it represents. Is it a movement of the crossfader.

Or the play button is pressed. There is no automatic way to get that information. The DJ software doesnt know what to do when it receives a MIDI message, if there is no mapping. Just plug them in, and DJ Player will recognize and use the appropriate factory mapping immediately. Every DJ software has its own mapping format. DJ Players MIDI mappings have the .djpm extension. DJ TechTools has a great mapping community where you can search for mappings. The MIDI screen lists the connected MIDI devices on top. Read more at DJWORX. Use this MIDI Table for mapping. If this is enabled, connecting a wired MIDI device to DJ Player turns all VOL knob to 0, silencing audio. DJ Player uses the tempo and beat phase information of its Master Deck for this. Ableton Link is a peertopeer technology, where DJ Player can be both master and slave. In other words, Ableton will follow the master deck instead of the master deck following Ableton. Tap on any mappable features name to begin or modify the mapping of that particular feature. Some controllers, especially those designed for Serato, send different messages when the SHIFT button is pressed on the controller. But the SHIFT button in DJ Player is implemented by software, so you need to have all input variants mapped here. However, changes are not saved into the disk yet, only if you tap on the disk icon save, which saves all changes immediately. DJ Player needs to know when the jog wheel is touched and when it is moved. Some controllers may send different messages when the jog wheel is touched and moved vs. You may need to use every Input1Input4 option. It controls the main parameter of the currently enabled effects on the corresponding deck. It controls the main parameter of the currently enabled effects on the corresponding deck. Triggering the jog touch event for all decks is possible with this. When enabled, touching the jog wheel also returns to the current cue point. You can map pitch bend to an encoder like that with this.

After you reached the limit, hold SHIFT and DJ Player will automatically extend the tempo range to a wider setting. You can freely reposition the physical control while you hold SHIFT. Release SHIFT and the control will work again. For example, a message sent on MIDI channel 1 becomes AL 1, and you can map that message to any mappable feature of DJ Player. Please try again. Please try again. Please try again. RustyRiver offers fast daily shipping and 100% customer satisfaction GUARANTEED. Moderate wear to cover. Then you can start reading Kindle books on your smartphone, tablet, or computer no Kindle device required. Register a free business account To calculate the overall star rating and percentage breakdown by star, we don't use a simple average. Instead, our system considers things like how recent a review is and if the reviewer bought the item on Amazon. It also analyzes reviews to verify trustworthiness. The required TSI files can be downloaded for all Hercules controllers d. To use a DJ controller, you need the Virt. If it feels like your Windows computer is slow for DJing, you should try making the following. The aggregate device. Then, make sure that iTunes option to share your iTunes library XML with other applications is enabled. To do so Make sure that your DJ controller is selected not. Connect your speakers to the DJ controllers Master output, or output 12 not to the computers audio output. Connect your

headphones. This preset is enabled by default this may cause crackling in the sound, and could even result in the DJ controller losing its connection. You should feel free to contact us.
